Functional differential equations with maxima, via step
by step contraction principle

T.A. Burton presented in some examples of integral equations a notion of progressive contractions on $C([a, \infty])$. In 2019, I.A. Rus formalized this notion (I.A. Rus, Some variants of contraction principle in the case of operators with Volterra property: step by step contraction principle, Advances in the Theory of Nonlinear Analysis and its Applications 3 (2019) No. 3, 111-120), put ”step by step” instead of ”progressive” in this notion, and give some variant of step by step contraction principle in the case of operators with Volterra property on $C([a, b], B)$ and $C([a, \infty], B)$, where $B$ is a Banach space. In this paper we use the abstract result given by I.A. Rus, to study some classes of functional differential equations with maxima.
